

GP End-to-End Trial Guide

A step-by-step script for trialling Cúram with a GP: every module, all three apps (web, HealthLink bridge, patient app), ending with the GP able to start using the platform for real. Allow **60-90 minutes**.

Contents

0. What you need before the session — 5 min
1. Staff web app — sign in and create the practice — 10 min
2. Settings — connect the integrations — 10 min
3. Invite staff — 5 min
4. Register a patient — 5 min
5. The clinical loop — the core demo — 20 min
6. HealthLink bridge — Electron agent — 15 min
7. Patient app — MyCúram on a phone — 10 min
8. Prove the compliance spine — 5 min

0. What you need before the session

Item	Why
GP's Google account (email + password)	Sign-in is Google OAuth only
A second Google account (optional)	Demonstrates staff invites + roles
Practice PC (Windows) with HealthLink cert	Runs the Electron bridge agent
Smartphone with Expo Go installed	Patient app demo
Stripe account (test mode keys wired)	Online payments demo
Practice's private fee schedule	Billing rates from practice_fees

■ The staff web app needs **nothing installed** — it runs at the deployed URL (e.g. <https://curam-phi.vercel.app>).

1. Staff web app — sign in and create the practice

Time: 10 minutes

1. Open the deployed URL — you are redirected to `/login`.
2. Click **Create a practice** — **Continue with Google** — sign in.
3. Fill: practice name, address, Eircode, phone — click **Create practice**. You are now the practice's first GP (this drives all role permissions).
4. You land on the dashboard.

Expect: The dashboard is empty — no demo patients anywhere. This is a real, clean environment.

2. Settings — connect the integrations

Time: 10 minutes

In **Settings**, top to bottom:

1. **Stripe** — click *Connect Stripe* — complete Stripe's hosted onboarding (business details, IBAN for payouts) — returned to Settings with status **connected**. Test mode today; flip to live keys at go-live.
2. **Google Calendar** — click *Connect my Google Calendar* — creates a secondary calendar "Cúram — <your name>" in your Google account.
3. **Healthmail** (optional today) — connect the practice's @healthmail.ie account for prescription sending. If the GP has no account yet, skip.

4. **Export workspace (JSON)** — point it out: GDPR data export, one click.

3. Invite staff

Time: 5 minutes

1. **Staff & rota** — invite a member by role (e.g. Nurse) — use the exact Google email they will sign in with.
2. "Invite pending" badge appears.
3. On the second account (private window): sign in with Google.

Expect: The pending badge clears and the sidebar shows only what their role allows. Reception cannot approve prescriptions; CDM needs nurse AND GP.

4. Register a patient

Time: 5 minutes

1. **Patients > Register:** name, DOB, phone (08X XXX XXXX), email (**use a real inbox you control** — the patient app needs it), GMS number or private, nominated pharmacy Healthmail address if known.
2. Done.

Expect: The patient appears in the panel list.

5. The clinical loop — the core demo

Time: **20 minutes** — this is the GP's daily bread

■ Walk this exact loop in order. Each step feeds the next.

5.1 Book the appointment

1. Open **Calendar** from the sidebar.
2. Find the column with your name (Day view = one column per clinician).
3. Click an empty slot in your column (time is picked automatically, rounded to 15 minutes) — the **Book appointment** panel opens.
4. Choose the **Patient**, adjust **Time** if needed, pick a **Type** (Routine, CDM, Urgent...), then click **Confirm booking**.
5. Navigate with **Today** and the **Day / Week / Month** switcher.

Expect: A coloured block appears in your column. The red line is *now*.

6. **Google Calendar check:** open the GP's Google Calendar in a new tab.

Expect: The appointment is there in the "Cúram" calendar, and a confirmation email went to the patient (once the sending domain is verified).

5.2 Walk the patient in

1. Open **Waiting room** from the sidebar — today's appointments are listed.
2. Click **Check in** on the patient's row.

Expect: They move to the waiting list, ready for the consult.

5.3 The consultation — AI scribe

1. Open the **patient's record** (Patients > click the patient) > click **Start consultation**.
2. Pick a **template** (GP consult, nurse review...) — the SOAP fields adapt.
3. In the **AI scribe** panel: tick **Patient consent for recording** (required — consent is logged); click **Start capture**, speak a sentence of clinical detail; click **Stop capture**, then **Structure SOAP**.
4. Review the transcript.

Expect: The SOAP fields fill themselves (Subjective / Objective / Assessment / Plan) with ICPC-2 codes suggested.

5. Click **Approve into note** for AI-drafted sections — nothing AI-generated is written into the record without a human click (HIQA rule).
6. Click **Sign note** > confirm.

Expect: The note is locked — signed notes are permanent and audit-logged.

5.4 Prescribe

1. On the patient's record (or **Prescriptions** page), create a prescription: drug, dose, frequency, duration, nominated pharmacy.
2. Open **Prescriptions** > find it > click **Approve** > confirm the dialog.

Expect: A GP sign-off is recorded (audit log), status changes — prescriptions are **never** auto-approved.

3. If the GP connected **Healthmail** in Settings: click **Send** to deliver it to the pharmacy's @healthmail.ie address.
4. Bonus loop: on the phone (patient app, section 7) request a repeat — it appears **pending** here for the GP to approve.

5.5 CDM — Chronic Disease Management (GMS patients)

■ CDM pays per review, but **both signatures are mandatory**.

1. Open **CDM programmes** > the patient appears under **Eligible** (GMS + chronic condition + not yet enrolled).
2. Click **Enrol** > consent confirmed, next review date set (+1 month).
3. **Nurse:** Start review > fill the measurement fields (HbA1c, BP, BMI...) > **Nurse sign**.
4. **GP** (sign in as the GP — role matters): the review shows under **Reviews due** > check the values > **GP sign-off**.
5. Done.

Expect: Review marked Completed; a **PCRS claim** is staged in Billing > PCRS claims; the enrolment's next review moved +6 months.

5.6 Referral

1. On the patient's record (or **Referrals** page) queue a referral — specialty, hospital, notes.
2. In **Referrals**, click **Approve & send** > confirm. With the bridge agent running it goes out via HealthLink and gets an acknowledgement; without it, it stays queued and sends when the bridge connects.

5.7 Billing — get paid

1. Complete a **private** appointment (mark it completed in the waiting room flow).

Expect: An invoice is created automatically at the practice's fee. GMS appointments never invoice — they're PCRS-claimed.

2. Open **Billing** > find the invoice > click **Payment link** > open the link on the phone.

3. Pay with Stripe's test card: 4242 4242 4242 4242, any future expiry, any CVC.
4. Done.

Expect: The invoice flips to **paid** automatically (webhook), a receipt is printable, and a payment audit entry is written. For walk-in cash/card, use **Cash / in-room** instead.

6. HealthLink bridge — Electron agent on the practice PC

Time: 15 minutes

Runs where the HealthLink digital certificate lives. Until formal integration testing (endpoint provisioning, build-plan month 16) it runs harmlessly: registration, heartbeats, and the full message pipeline minus the HealthLink wire itself.

1. On the practice PC, open the **HealthLink** page in the staff web app > **Download for Windows/Mac** (platform-detected; installers hosted on the public curam-releases GitHub repo — nothing to clone, no Node).
2. Install (Windows: one-click Setup exe; macOS: open the dmg). The app lives in the **system tray** with a status dot and starts with the OS.
3. Get the bootstrap key: Supabase secret `BRIDGE_API_KEY`.
4. First run: the agent registers against the practice and receives its own per-agent key (saved to `%APPDATA%/curam-bridge/config.json`).
5. Confirm in the **HealthLink** page.

Expect: The agent shows as registered/heartbeating.

Simulate the pipeline

1. Inbound lab result (ORU) > lands in **HealthLink** page + urgent inbox; abnormal flags force **GP callback** delivery — never AI.
2. Referral round-trip: queue in Cúram > outbox > ack > acked. Full curl commands: `docs/testing.md §3`.

To release a new bridge version: bump the version in `bridge-agent/package.json`, run `npm run dist:win / dist:mac`, upload to a new release in `curam-releases`, and bump `BRIDGE_VERSION` in `src/pages/healthlink.tsx`.

7. Patient app — MyCúram on a phone

Time: 10 minutes

■ The patient's email (step 4) must be on file in Cúram.

1. Install **Expo Go** on the phone.
2. Set the Supabase anon key in `patient-app/app.json` > `extra.supabaseAnonKey`, then: `cd patient-app && npm install && npm start`

3. Scan the QR with Expo Go > sign in with the **patient's email** (magic link — first sign-in links the account to the patient record).

Demo on the phone

- **Home**: next appointment, quick actions
- **Book**: pick clinician + slot > books into the real diary
- **Repeats**: request a repeat > appears pending in the staff app
- **Results**: normal results show GP comments
- **Messages**: two-way messaging with the practice

Abnormal results never show values — the app asks the patient to phone the practice.

5. **Public booking**: open /book in any phone browser (no login) > book > appears in the diary.

8. Prove the compliance spine

Time: **5 minutes** — HIQA/GDPR is the selling point

1. **Supabase > audit_log**: every action today (logins, signed notes, Rx approvals, payments) has an entry.
2. **Settings > Export workspace (JSON)**: full GDPR data export.
3. **RLS isolation**: data from practice A is invisible to practice B, enforced at the database level.

Known gaps to mention during the trial

Feature	Status
HealthLink wire format	Real endpoint at formal integration testing (month 16) — everything else is live
Booking/reminder emails	Blocked until the Resend sending domain DNS is verified
WhatsApp reminders	Needs approved Twilio Content Templates
Site voice calls end-to-end	Needs voice platform account + phone number
Automated insurer claims	Deliberately deferred ("coming soon" in UI)

After the trial — go-live checklist

1. Switch Stripe from test to live keys (platform + practice onboarding).
2. Verify the Resend sending domain; approve WhatsApp templates.

3. Create a staging Supabase project; move trial test data out of dev.
4. Envelope-encrypt Healthmail credentials (migration 027 TODO).
5. Real HealthLink certificates + endpoint scheduling via GPIT.
