

Cúram

GP End-to-End Trial Guide

A step-by-step script for trialling Cúram with a GP: every module, all three apps (web, HealthLink bridge, patient app), ending with the GP able to start using the platform for real. Allow 60–90 minutes.

Contents

0. What you need before the session

1. Staff web app — sign in and create the practice (10 min)

2. Settings — connect the integrations (10 min)

3. Invite staff (5 min)

4. Register a patient (5 min)

5. The clinical loop — the core demo (20 min)

6. HealthLink bridge — Electron agent on the practice PC (15 min)

7. Patient app — MyCúram on a phone (10 min)

8. Prove the compliance spine (5 min)

Known gaps to mention during the trial

After the trial — go-live checklist

0. What you need before the session

Item	Why
GP's Google account (email + password)	Sign-in is Google OAuth only
A second Google account (optional)	Demonstrates staff invites + roles
Practice PC (Windows) with the HealthLink digital certificate	Runs the Electron bridge agent
A smartphone (GP's or yours) with Expo Go installed	Patient app demo
Stripe account (test mode keys already wired)	Online payments demo
Ledger of the practice's private fees	Billing rates come from <code>practice_fees</code>

The staff web app needs **nothing installed** — it runs at the deployed URL (e.g. `https://curam-phi.vercel.app`).

1. Staff web app — sign in and create the practice (10 min)

1. Open the deployed URL → you are redirected to `/login`.
2. Click **Create a practice** → **Continue with Google** → sign in.
3. Fill: your name, practice name, address, Eircode, phone → **Create practice**.
 - You are now the practice's first GP (this drives all role permissions).
4. **Expect**: the dashboard, empty of data — no demo patients anywhere.

2. Settings — connect the integrations (10 min)

In **Settings**, top to bottom:

1. **Stripe** → *Connect Stripe* → complete Stripe's hosted onboarding (business details, IBAN for payouts) → returned to Settings with status **connected**. (Test mode today; flip to live keys at go-live.)
2. **Google Calendar** → *Connect my Google Calendar* → creates a secondary calendar "Cúram — <your name>" in your Google account.
3. **Healthmail** (optional today) → connect the practice's `@healthmail.ie` account for prescription sending. If the GP has no account yet, skip — prescriptions can be approved and sent later.
4. **Export workspace (JSON)** — point it out: GDPR data export, one click.

3. Invite staff (5 min)

1. **Staff & rota** → invite a member by role (e.g. Nurse) — use the exact Google email they will sign in with.
2. **Expect:** "Invite pending" badge.
3. On the second account (private window): sign in with Google → the pending badge clears and the sidebar shows only what their role allows (reception cannot approve prescriptions; CDM needs nurse AND GP).

4. Register a patient (5 min)

1. **Patients** → **Register**: name, DOB, phone (08X XXX XXXX), email (**use a real inbox you control — the patient app needs it**), GMS number or private, nominated pharmacy Healthmail address if known.
2. **Expect:** the patient appears in the panel list.

5. The clinical loop — the core demo (20 min)

This is the GP's daily bread — walk it start to finish with the patient you registered (we'll call them "the patient" below).

5.1 Book the appointment

1. Open **Calendar** from the sidebar.
2. Find the column with your name (Day view = one column per clinician).
3. Click an empty slot in your column (the time is picked automatically, rounded to 15 minutes) — the **Book appointment** panel opens.
4. Choose the **Patient**, adjust **Time** if needed, pick a **Type** (Routine, CDM, Urgent...), then click **Confirm booking**.
5. **Expect:** the panel closes and a coloured block appears in your column.
6. Navigate with **Today** and the **Day / Week / Month** switcher; click **Pick date** to jump. The red line is *now*.
7. **Google Calendar check:** open the GP's Google Calendar in a new tab — the appointment is there ("Cúram — <GP name>" calendar), and a confirmation email went to the patient (once the sending domain is verified — see Known gaps).

5.2 Walk the patient in

1. Open **Waiting room** from the sidebar — today's appointments are listed.
2. Click **Check in** on the patient's row.
3. **Expect:** they move to the waiting list, ready for the consult.

5.3 The consultation — Síle scribe

1. Open the **patient's record** (Patients → click the patient) → click **Start consultation**.
2. Pick a **template** (GP consult, nurse review...) — the SOAP fields adapt.
3. In the **Síle scribe** panel on the right:

- tick **Patient consent for recording** (required — consent is logged);
 - click **Start capture**, speak a sentence of clinical detail out loud (e.g. "Patient is a 62-year-old with type 2 diabetes, HbA1c 8.2 on metformin, feels tired lately") — the mic icon asks permission once;
 - click **Stop capture**, then **Structure SOAP**.
4. **Expect:** the transcript appears and the SOAP fields fill themselves (Subjective / Objective / Assessment / Plan) with ICPC-2 codes suggested.
 5. Review, edit anything, then click **Approve into note** for AI-drafted sections — nothing AI-generated is written into the record without a human click (HIQA rule).
 6. Click **Sign note** → confirm. **Expect:** the note is locked — signed notes are permanent and audit-logged.

5.4 Prescribe

1. On the patient's record (or **Prescriptions** page), create a prescription: drug, dose, frequency, duration, nominated pharmacy.
2. Open **Prescriptions** → find it → click **Approve** → confirm the dialog. **Expect:** a GP sign-off is recorded (audit log), status changes — prescriptions are **never** auto-approved.
3. If the GP connected **Healthmail** in Settings: click **Send** to deliver it to the pharmacy's `@healthmail.ie` address.
4. Bonus loop: on the phone (patient app, section 7) request a repeat — it appears **pending** here for the GP to approve.

5.5 CDM — Chronic Disease Management (GMS patients)

CDM pays per review, but **both signatures are mandatory**:

1. Open **CDM programmes** → the patient appears under **Eligible** (GMS + chronic condition + not yet enrolled).
2. Click **Enrol** → consent confirmed, next review date set (+1 month).
3. **Nurse**: Start review → fill the measurement fields (HbA1c, BP, BMI...) → **Nurse sign**.
4. **GP** (sign in as the GP — role matters): the review shows under **Reviews due** → check the values → **GP sign-off**.
5. **Expect:** review marked Completed; a **PCRS claim** is staged in **Billing** → **PCRS claims**; the enrolment's next review moved +6 months.

5.6 Referral

1. On the patient's record (or **Referrals** page) queue a referral — specialty, hospital, notes.
2. In **Referrals**, click **Approve & send** → confirm. With the bridge agent running it goes out via HealthLink and gets an acknowledgement; without it, it stays queued and sends when the bridge connects.

5.7 Billing — get paid

1. Complete a **private** appointment (mark it completed in the waiting room flow). **Expect:** an invoice is created automatically at the practice's fee. (GMS appointments never invoice — they're PCRS-claimed.)
2. Open **Billing** → find the invoice → click **Payment link** → open the link on the phone.
3. Pay with Stripe's test card: `4242 4242 4242 4242`, any future expiry, any CVC.

4. **Expect:** the invoice flips to **paid** automatically (webhook), a receipt is printable, and a payment audit entry is written. For walk-in cash/card, use **Cash / in-room** instead.

5.8 Chat with Síle (beta, optional)

1. Click the teal **sparkle bubble** in the bottom-right corner (any page).
2. Ask something, e.g. *"What's pending today?"* — Síle answers from a live practice snapshot (today's schedule, results awaiting review, drafts) plus the page you're on.
3. **Expect:** an answer in seconds. Síle is read-only — it never changes records, and every conversation is metered against the practice's monthly AI cap (see **Settings** → **Síle AI — chat (beta)** to switch it off if spend matters; the scribe and briefing stay on regardless).

6. HealthLink bridge — Electron agent on the practice PC (15 min)

Runs where the HealthLink digital certificate lives. Until formal integration testing (endpoint provisioning, build-plan month 16) it runs harmlessly: registration, heartbeats, and the full message pipeline minus the HealthLink wire itself.

1. On the practice PC, open the **HealthLink** page in the staff web app → **Download for Windows/Mac** (platform-detected; installers are hosted on the public `curam-releases` GitHub repo — nothing to clone, no Node).
2. Install (Windows: one-click Setup exe, runs after install; macOS: open the dmg). The app lives in the **system tray** with a status dot and starts with the OS.
3. Get the bootstrap key: Supabase secret `BRIDGE_API_KEY`.
4. First run: the agent registers against the practice and receives its own per-agent key (saved to `%APPDATA%/curam-bridge/config.json`).
5. Confirm in the **HealthLink page** that the agent shows as registered/heartbeating.
6. **Simulate the pipeline** (from any machine, using the agent key):
 - inbound lab result (ORU) → lands in **HealthLink** page + urgent inbox; abnormal flags force **GP callback** delivery — never AI;
 - referral round-trip: queue in Cúram → outbox → ack → `acked`. Full curl commands: `docs/testing.md` §3.

To release a new bridge version: bump the version in `bridge-agent/package.json`, run `npm run dist:win / dist:mac`, upload the installers to a new release in `curam-releases`, and bump `BRIDGE_VERSION` in `src/pages/healthlink.tsx`.

7. Patient app — MyCúram on a phone (10 min)

The patient's email (step 4) must be on file in Cúram.

1. Install **Expo Go** on the phone.
2. Set the Supabase **anon key** in `patient-app/app.json` → `extra.supabaseAnonKey`, then:

```
cd patient-app && npm install && npm start
```

- 3. Scan the QR with Expo Go → sign in with the **patient's email** (magic link — first sign-in links the account to the patient record).
- 4. Demo on the phone:
 - **Home**: next appointment, quick actions
 - **Book**: pick clinician + slot → books into the real diary
 - **Repeats**: request a repeat → appears pending in the staff app
 - **Results**: normal results show GP comments; **abnormal results never show values** — the app asks the patient to phone the practice
 - **Messages**: two-way messaging with the practice
- 5. **Public booking**: open `/book` in any phone browser (no login) → book → appears in the diary.

8. Prove the compliance spine (5 min)

HIQA/GDPR is the selling point — show it:

- 1. **Supabase** → `audit_log`: every action today (logins, signed notes, Rx approvals, payments) has an entry.
- 2. **Settings** → **Export workspace (JSON)**: full GDPR export.
- 3. **RLS isolation** (two practices only): data from practice A is invisible to practice B, enforced at the database.

Known gaps to mention during the trial

Feature	Status
HealthLink wire format	Real endpoint at formal integration testing (month 16) — everything else is live
Booking/reminder emails	Blocked until the Resend sending domain DNS is verified
WhatsApp reminders	Needs approved Twilio Content Templates (number has no SMS capability)
VoiceHub calls end-to-end	VoiceHub (sister app) makes patient phone calls; Síle surfaces its call insights in Cúram. Needs VoiceHub's voice platform account + phone number
Automated insurer claims	Deliberately deferred ("coming soon" in UI)

After the trial — go-live checklist

- 1. Switch Stripe from test to live keys (platform + practice onboarding).
- 2. Verify the Resend sending domain; approve WhatsApp templates.
- 3. Create a staging Supabase project; move trial test data out of dev.

4. Envelope-encrypt Healthmail credentials (migration 027 TODO).
5. Real HealthLink certificates + endpoint scheduling via GPIT.
